

Qwen3-32B FP8 matched-seam deployment frontier

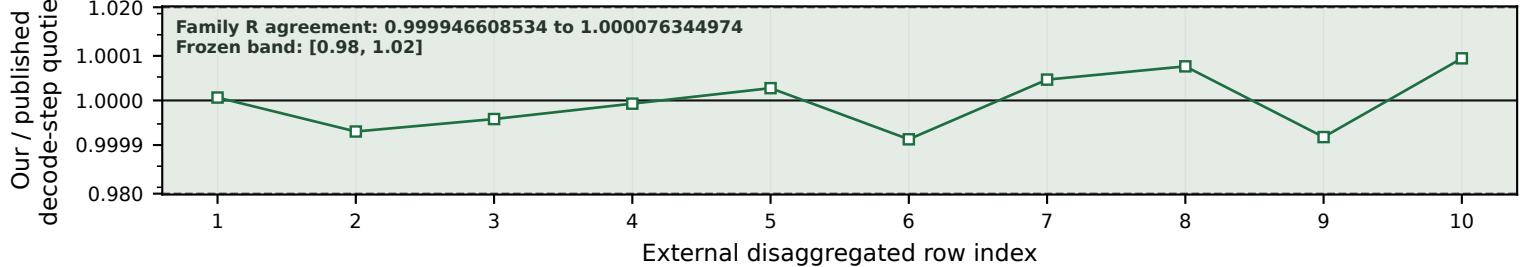

(a) Published deployment frontier

(b) Network pricing, external row 3

(c) Matched decode step, symmetric-log distance about 1

Every SimLLM compute duration comes from the same imported measured database. Aggregate differences are in-flight composition, not kernel timing. The aggregate pool co-locates prefill and decode, so both of its P/D handoff arms carry zero bytes and coincide exactly.
