

Qwen3-32B FP8 matched-seam deployment frontier

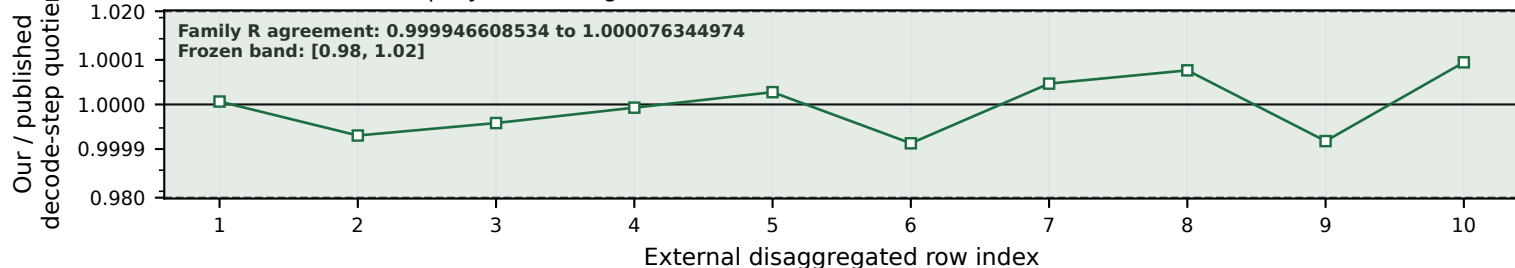

(a) Published deployment frontier

(b) Network pricing, external row 3

(c) Matched decode step, symmetric-log distance about 1

Shared timing base: their aggregate and disaggregated series and our unpriced-network series all price the same imported MEASURED-EXTERNAL operation database, so their curve differences are composition rather than kernel timing; our packet-priced series keeps that base and adds SIM-DERIVED network service. The arrow compares that complete network charge with zero network service at this workload, ratio 1.042715399805. The optional LogGOPSim-priced third arm did not run, so this figure does not isolate receiver-side serialization. The separate eight-into-one fan-in envelope from frontier_ladder_v1 and loggopsim_acceptance_v1 is a different schedule regime and is not plotted on these curves. F-2-09 remains a published rounded-axis refutation at frontier / external = 0.607495219355.
