

Deployment frontier ladder and ideal-level validity envelope

— Closed-form line ○ ESTIMATE △ Ideal rung ● Packet SIMULATED — Packet Pareto ◇ Published paired

a. Three-rung deployment frontier

b. Mechanism envelope

The ideal level stays within about 1.6% for serialized point-to-point traffic.

It is about 8x optimistic for eight-into-one incast because it does not serialize the shared receiver ingress.

At step level the H100 kernel masks both fabric differences; only the pinned B100 batch-32 intra-node packet excess moves a point.

H100 2N and 9N coincide at step level in the pinned record; dashed 2N over the wider 9N line makes both visible.
