

Qwen3-32B FP8 matched-seam deployment frontier

-●- Their aggregate, MEASURED-EXTERNAL -○- Our contention off (ideal), MEASURED-EXTERNAL
 -◇- Their disaggregated, MEASURED-EXTERNAL -▲- Our contention on (packet), MEASURED-EXTERNAL + SIM-DERIVED

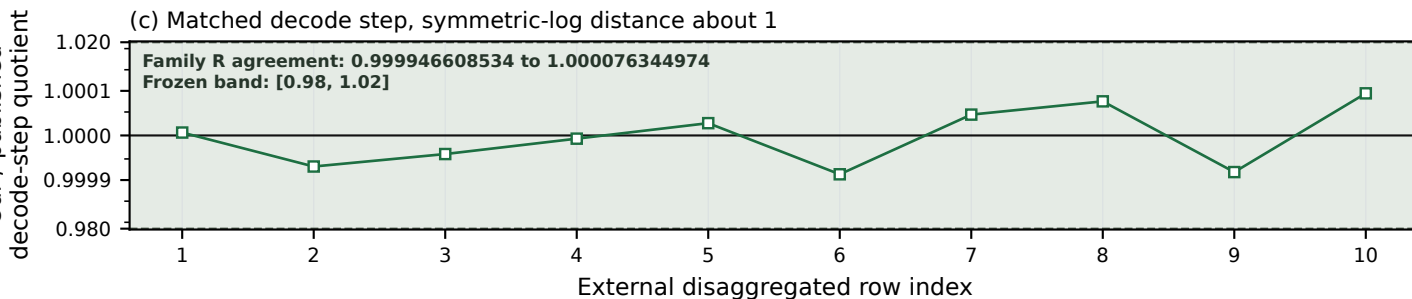

(a) Published deployment frontier

(b) Mechanism zoom, external row 3

(c) Matched decode step, symmetric-log distance about 1

Shared timing base: their aggregate and disaggregated series and our contention-off series all price the same imported MEASURED-EXTERNAL operation database, so their curve differences are composition rather than kernel timing; our contention-on series keeps that base and adds SIM-DERIVED packet redistribution. The arrow reports receiver-side serialization under fan-in at this workload, packet / ideal = 1.042715399805. The separate eight-into-one fan-in envelope from frontier_ladder_v1 and loggopsim_acceptance_v1 is a different schedule regime and is not plotted on these curves. F-2-09 remains a published rounded-axis refutation at frontier / external = 0.607495219355.
